

# Citología de LCR:

No solo la morfología, la preparación  
de la muestra como pilar fundamental  
del diagnóstico

Dra. L. Faridi Villegas

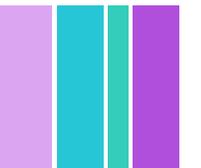

# Funciones del LCR

- Rodea el cerebro protege del impacto con el cráneo
- Hacer flotar el cerebro y “disminuir” su peso
- Regula la concentración de electrolitos, hormonas, neurotransmisores
- Transporta sustancias para su eliminación
- Administrar medicamentos que no atraviesan la barrera hematoencefálica.

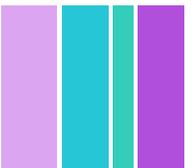

# Componentes del LCR

<b>Nutrition Facts</b>	
<b>Serving size:</b> 100 ml / 500 ml ..g	
Agua	
Proteínas	
Glucosa	
Iones	
Vitaminas	
Neurotransmisores.	

\*Percent Daily Values are based on 2.000 calorie diet. Your daily values may be higher or lower depending on your calorie needs.

---

# Obtención del LCR

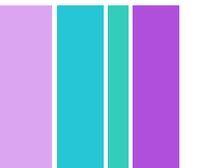

- Punción (procedimiento invasivo)
  - Lumbar
  - Sub occipital
  - Directamente de los ventrículos
- Lumbar: entre la 3ra y 4ta o 4ta y 5ta espacio intervertebral
- Medir la presión al inicio (50 a 180mm Hg)
- Detener la punción 10-30 mm Hg.
- Dividir la muestra en diferentes contenedores

# Estudio citológico

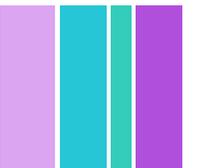

- Identificación de neoplasias / estadio clínico
- Primarios
- Secundarios
- Linfoma / leucemia
- Infecciones

# Estudio citoquímico

- Color
- Aspecto
- Coagulo
- Glucosa
- Proteínas totales
- Células totales
  - % polimorfonucleares
  - %mononucleares
  - Cuenta de eritrocitos mm<sup>3</sup>
- Deshidrogenasa láctica

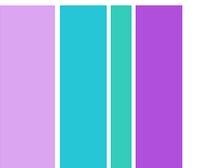

# Líquido cefalorraquídeo

# Fijación

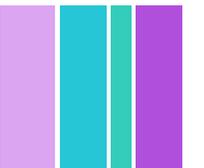

- Carbowax: Alcohol, polietilenglicol, rifampicina.
- Alcohol 96%
  - Proporción 1:1
- Conservar la morfología
  - Realizar estudios adicionales
    - Tinciones especiales
    - inmunohistoquímica

# Tinción

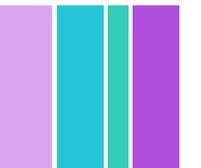

- Se recomienda filtrar las tinciones previamente
- Solamente teñir LCR
- Recomendando dos tinciones
  - Hemacolor, Diff Quik, Wright-Giemsa
  - Papanicolaou (h&e)

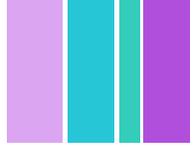

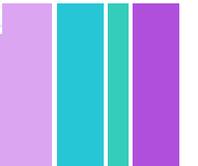

# Preparación de la laminilla

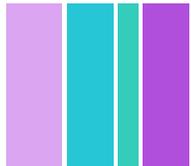

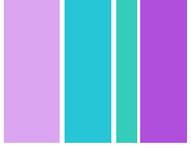

- Citocentrifuga (cytospin)
- No se recomienda el extendido por la escasez de celularidad

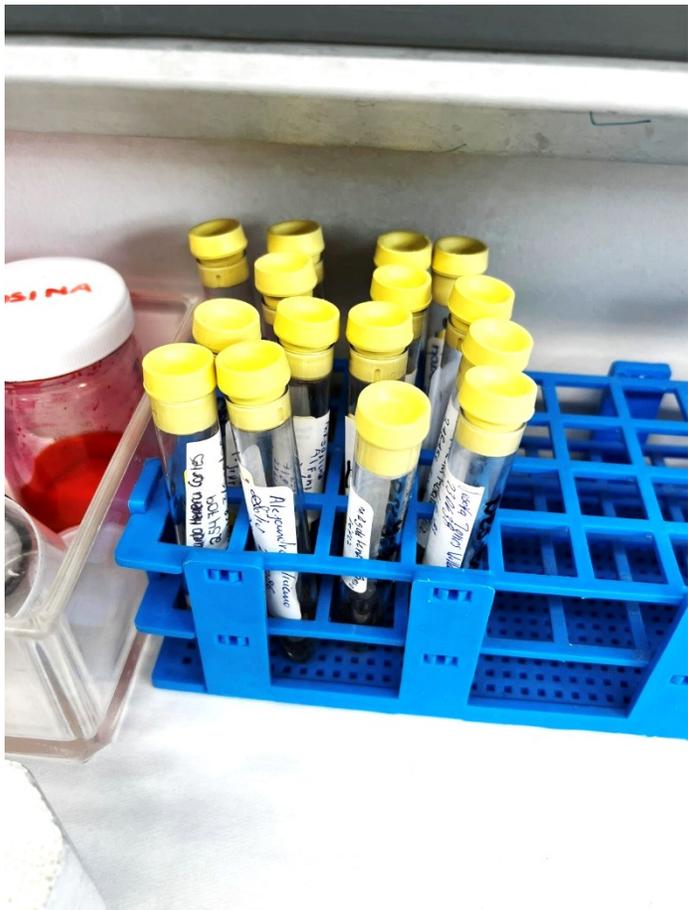

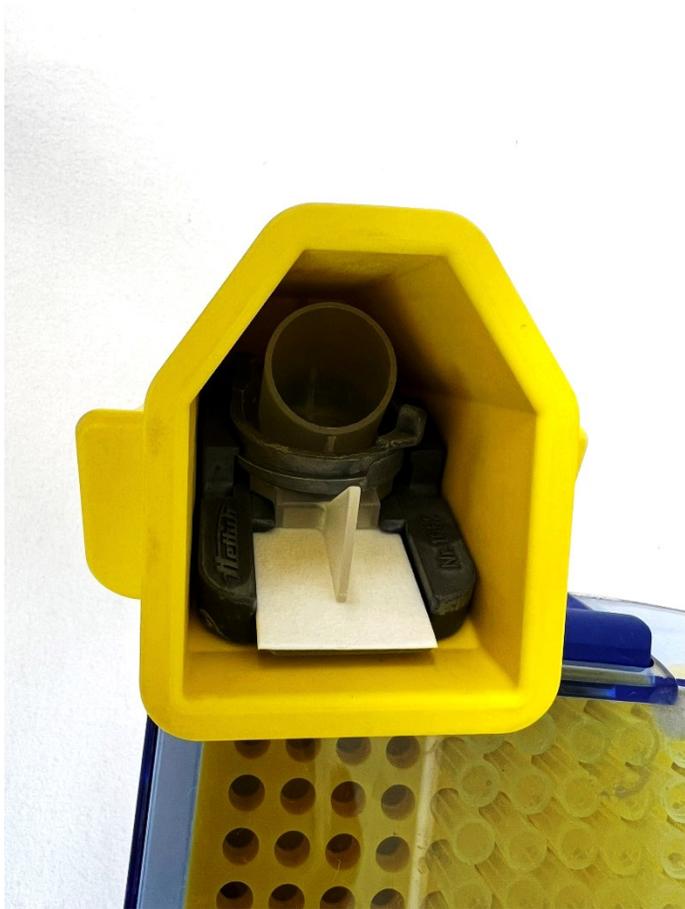

# Proceso

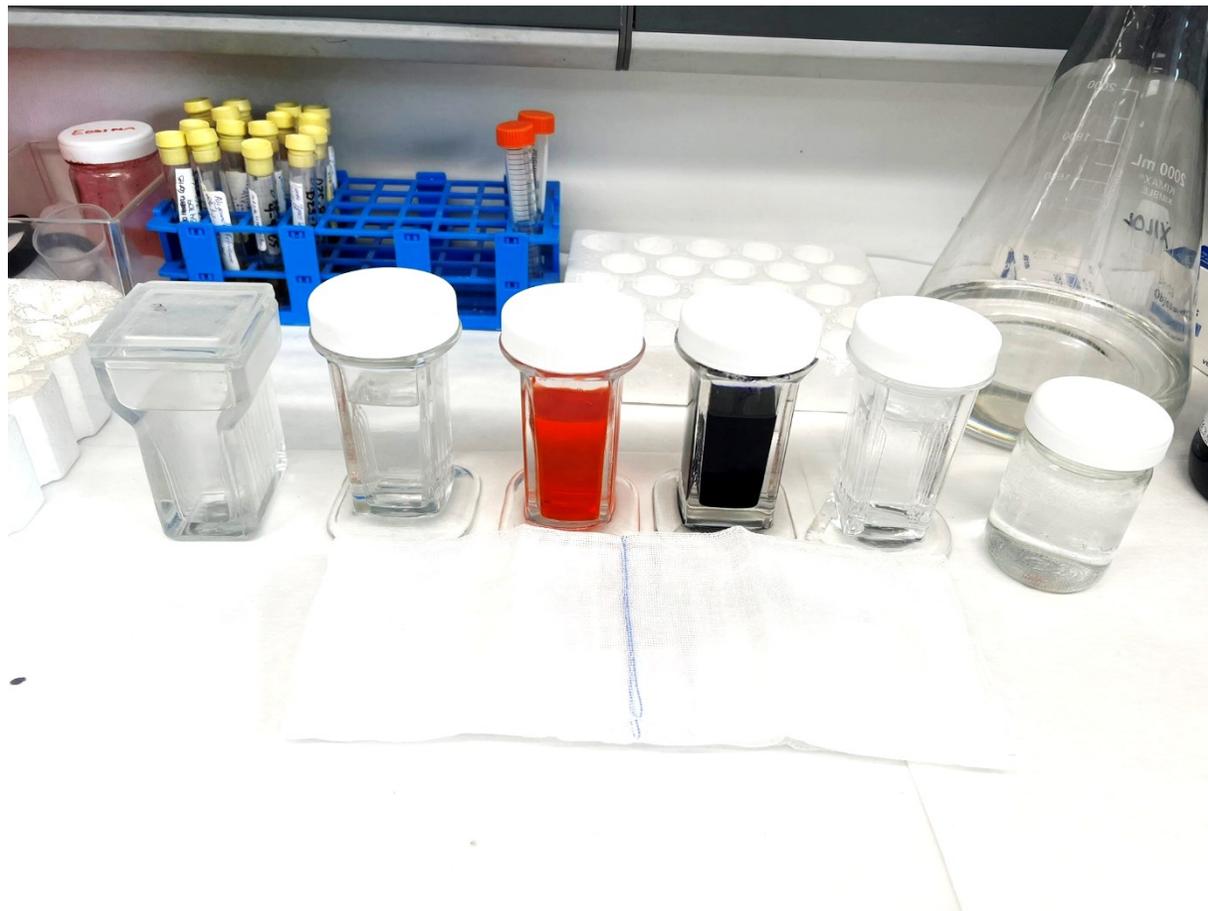

2500 RPM durante 5 minutos

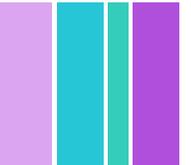

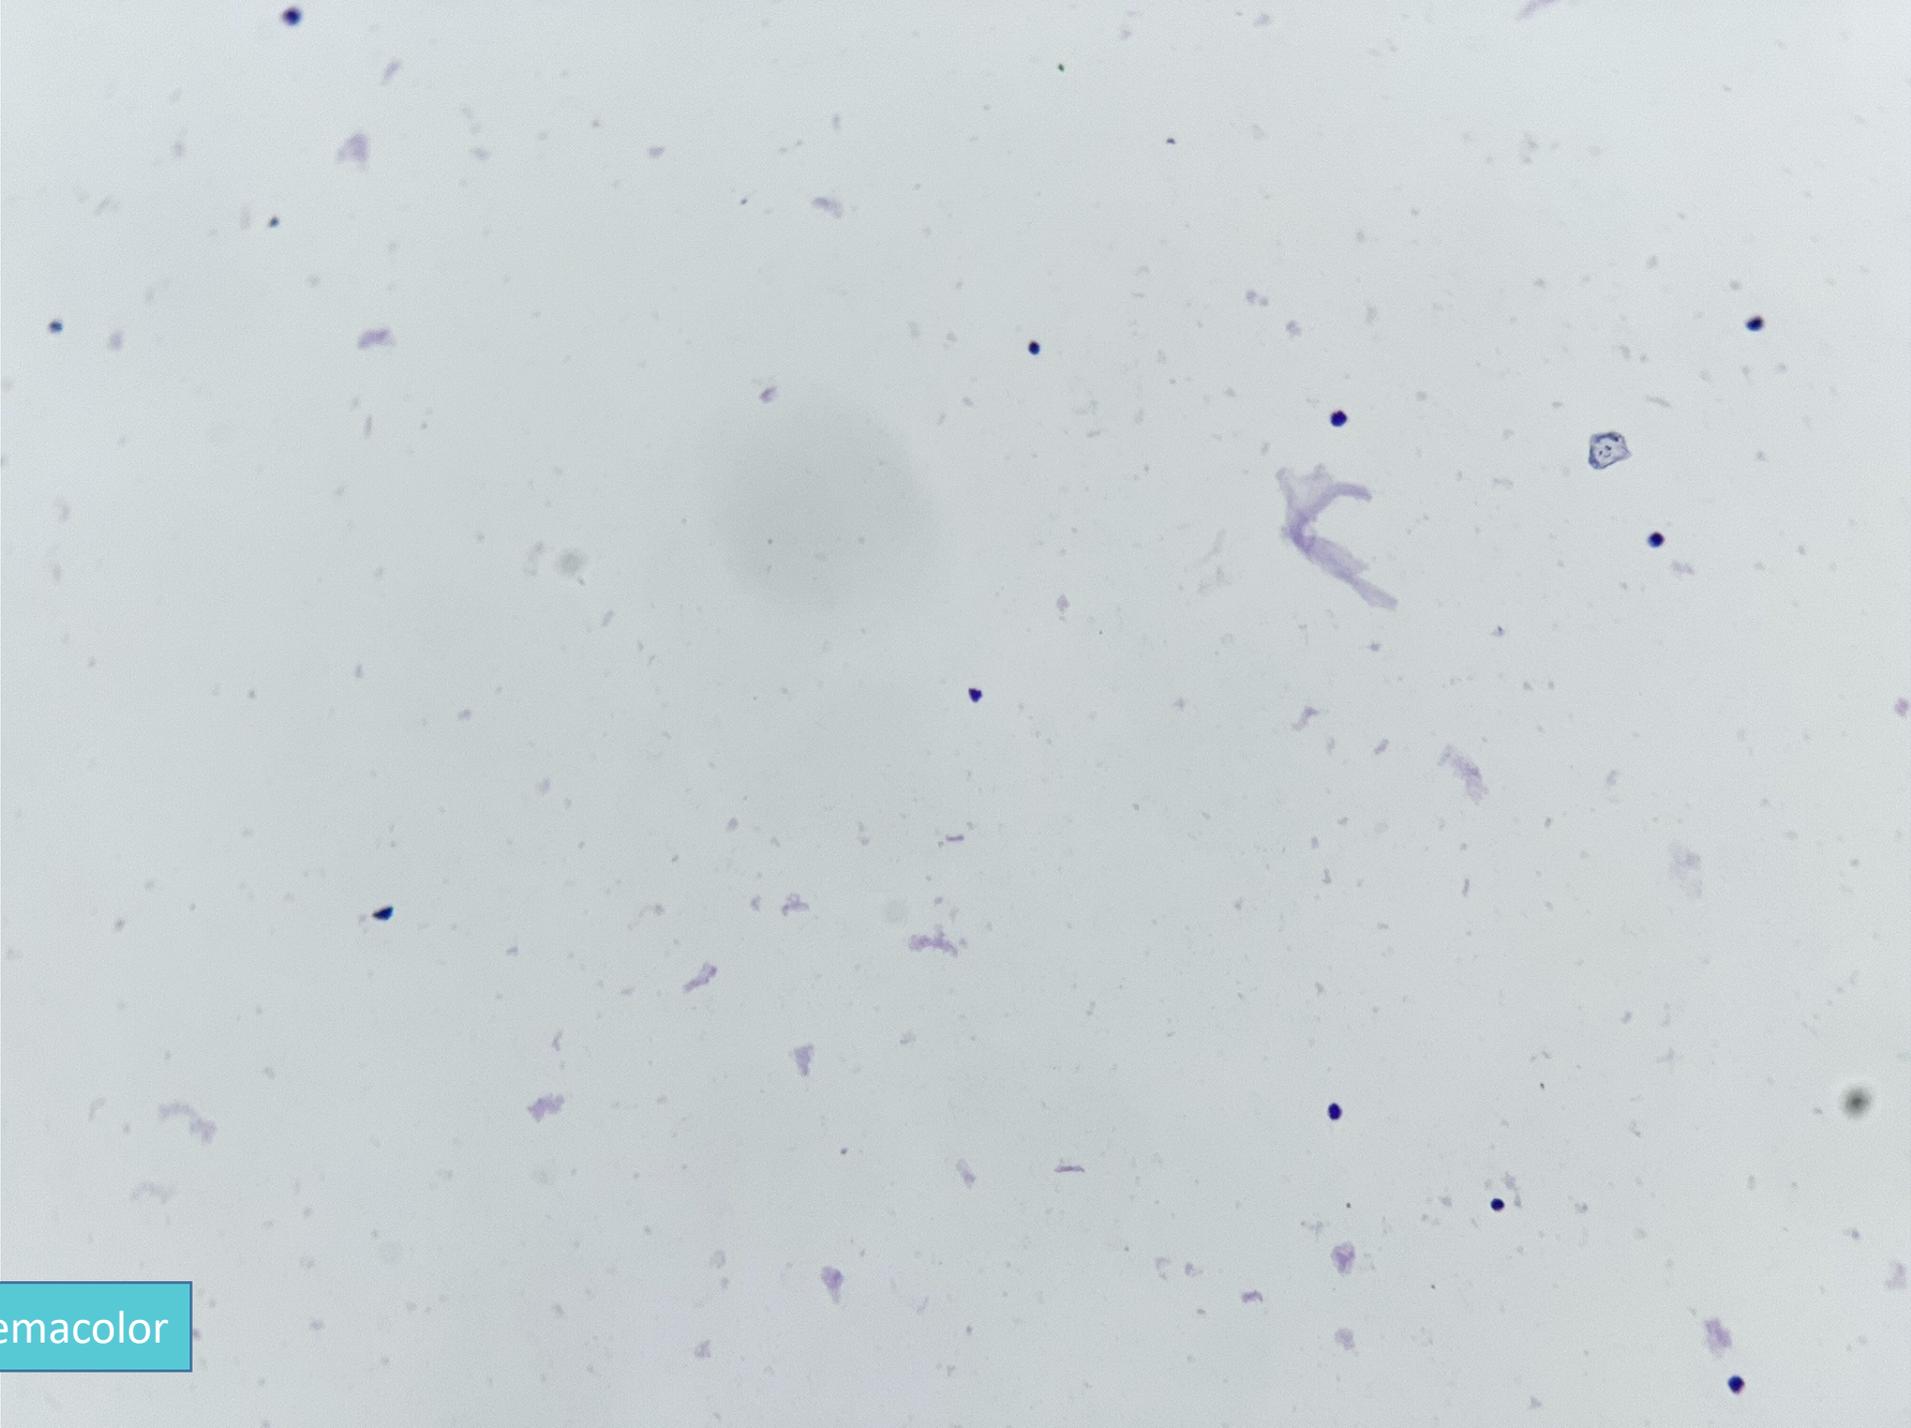

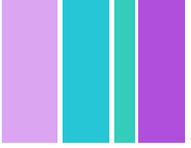

# Tren de tinción de hemacolor

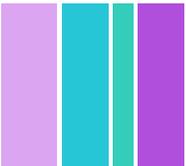

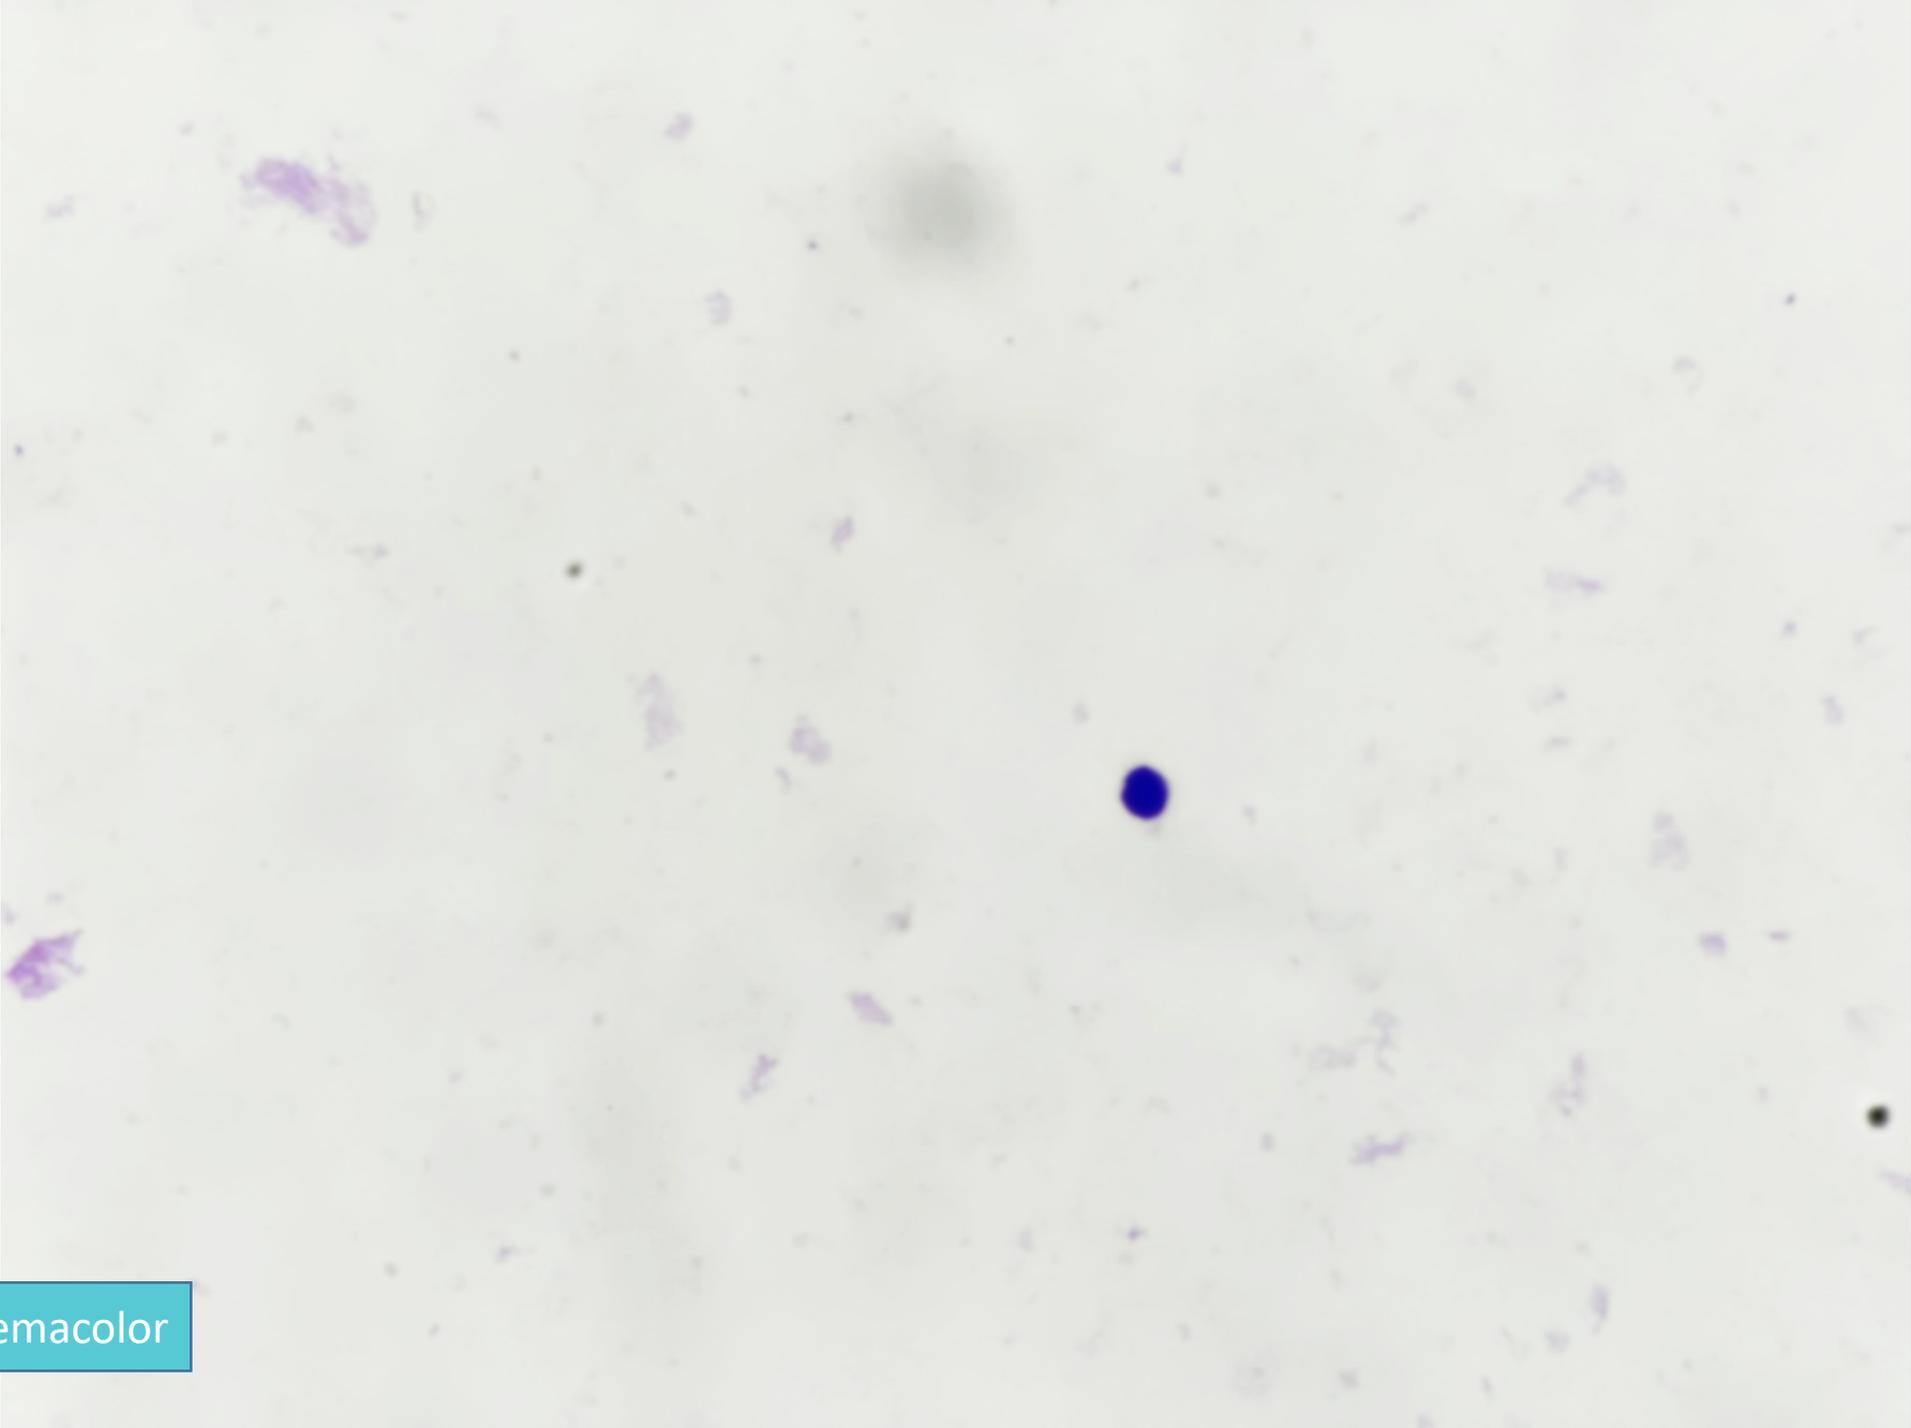

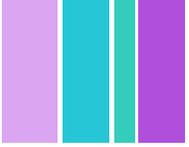

# Liquido cefalorraquideo normal
